PROFESSIONAL SUMMARY

DevOps and Cloud Engineer with hands-on experience in AWS, CI/CD, Infrastructure as Code, Linux and server administration, containerization, automation, and production deployments.Experienced in containerizing applications, managing Linux servers, securing applications and infrastructure, database management, production environments, and troubleshooting.

Started my technology journey in **Full-Stack Development**, building web applications with Python, React, REST APIs, and databases.

Built an **AI-powered Disease Prediction and Health Analytics System** as my Final Year Project, integrating machine learning with a complete web application.

Combining **software development and cloud engineering** to build, deploy, secure, automate, monitor, troubleshoot, and operate reliable and cost-efficient applications.

CORE TECHNICAL SKILLS

Cloud & Cost Optimization: AWS (EC2, VPC, IAM, S3, EKS, ECR, Fargate), cost-aware architecture, resource optimization, efficient cloud deployment

Infrastructure as Code: Terraform (modules, state management, workspaces), Ansible (playbooks, roles, inventories)

Containers & Orchestration: Docker, Docker Compose, Kubernetes (EKS, Minikube, kubectl), Helm **CI/CD:** Jenkins (Pipeline-as-Code, Multibranch, Shared Libraries), GitHub Actions, webhooks, Nexus Repository, Docker Hub, Amazon ECR

Linux & Server Administration: Ubuntu, CentOS, Nginx, Apache, web server configuration, cloud and server networking, troubleshooting

Monitoring & Observability: Prometheus, Grafana, Alertmanager, Node Exporter

Scripting & Automation: Python, Bash

Full-Stack Development: Python (FastAPI, Flask), React.js, TypeScript, REST APIs, PostgreSQL, SQLite

Version Control: Git, GitHub, branching strategies, code reviews

PROFESSIONAL EXPERIENCE

DevOps and Cloud Engineer (August 2026 – Present)

Metavystic Software Company — Islamabad, Pakistan

- Build and maintain CI/CD pipelines in Jenkins and GitHub Actions that automate build, test and deployment workflows for microservices-based applications.
- AWS Cost Optimization
- Containerise applications with Docker and deploy them to Kubernetes on Amazon EKS, using Helm charts, rolling updates and autoscaling configuration.
- Provision AWS infrastructure (EC2, VPC, IAM, S3, ECR, EKS) with Terraform to keep environments repeatable and version-controlled.
- Automate Linux server configuration and application deployment with Ansible, including Nginx web server setup. • Maintain container registries and artifact repositories (Nexus, Amazon ECR) for image versioning and artifact storage. • Configure Prometheus and Grafana monitoring with Alertmanager rules to detect and respond to infrastructure issues. • Manage credentials securely through Jenkins credentials and AWS IAM, and support development teams with Git branching and code review workflows.
- Troubleshoot issues across Linux servers, Kubernetes pods, networking and AWS VPC connectivity.

PROJECTS

CloudLens — AWS Monitoring and Cost Intelligence Platform

Technologies: *Python, FastAPI, PostgreSQL, SQLAlchemy, Alembic, Redis, Celery, boto3, React, TypeScript, Docker, Nginx*
Full-stack platform that gives visibility into AWS resources, metrics and costs across connected AWS accounts. • Built a FastAPI backend with Celery workers that collect data from AWS APIs (EC2, EKS, ECS, Lambda, RDS, S3, VPC, IAM, CloudWatch, Cost Explorer) into PostgreSQL and Redis.

- Connected AWS accounts through STS cross-account role assumption, encrypted stored credentials, and added JWT authentication, rate limiting and Prometheus metrics.
- Developed a React/TypeScript dashboard for inventory, cost, alerts and IAM views, and packaged both services in multi-stage Docker images with non-root users and health checks.

AWS Infrastructure Automation and Monitoring Stack

Technologies: *Terraform, Ansible, AWS (VPC, EC2, Security Groups), Nginx, Prometheus, Node Exporter, Grafana*
Infrastructure-as-Code project that provisions an AWS environment and configures a monitored web server end to end. • Provisioned a VPC, public subnet, internet gateway, route table, security group and Ubuntu EC2 instance with Terraform, with outputs for IP and SSH access.

- Wrote Ansible playbooks and roles to install Nginx, Node Exporter, Prometheus and Grafana on the provisioned server.
- Defined Prometheus alert rules for high CPU, high memory and instance-down conditions.

CI/CD and Kubernetes Deployment — AI Hotel Reservation System

Technologies: *Jenkins, Docker, Docker Hub, Kubernetes, Flask, React, SQLite, Nginx*
Full-stack reservation application delivered through a Jenkins pipeline and deployed with Kubernetes manifests. • Created a webhook-triggered Jenkins pipeline that injects environment files from Jenkins credentials, builds backend and frontend images, and pushes them to Docker Hub.

- Wrote Kubernetes manifests with a dedicated namespace, two backend replicas, ConfigMaps, Secrets, a gp2-backed PersistentVolumeClaim and a LoadBalancer Service.
- Developed Flask REST APIs with JWT authentication, bcrypt hashing, role-based admin access and rule-based room recommendations.

Task Management Application with CI/CD Pipeline

Technologies: *Jenkins, GitHub Actions, Docker, Docker Compose, Node.js, Express, TypeScript, Prisma, PostgreSQL, React* Containerised full-stack task manager with automated build, test and image publishing.

- Built a Jenkins pipeline that tags client and server images with the build number, pushes them to Docker Hub and logs out after every run.
- Set up a GitHub Actions workflow that installs dependencies, builds and runs tests on every push and pull request. • Developed a TypeScript REST API with JWT authentication, Prisma/PostgreSQL and OpenAPI (Swagger) documentation.

AI-Driven Disease Prediction and Health Analytics System — Final Year Project

Technologies: *Python, FastAPI, PyTorch, React (Vite), Tailwind CSS, SQLite, FPDF*
Full-stack web application that suggests likely conditions from selected symptoms, for educational and research purposes. • Trained a PyTorch neural network on a symptom dataset and served predictions through FastAPI endpoints for prediction, history, analytics and reports.

- Added explainable-AI output showing the symptoms that contributed most to each prediction, with High/Moderate/Low risk levels.
- Built a React dashboard for symptom selection, results and analytics, stored every prediction in SQLite and generated printable PDF reports.

EDUCATION

Bachelor of Science in Computer Science (BSCS)

Bahauddin Zakariya University — Multan, Pakistan

- Final Year Project: AI-Driven Disease Prediction and Health Analytics System (React, FastAPI, machine learning).

CERTIFICATIONS AND TRAINING

- DevOps Bootcamp — TechWorld with Nana
- AWS Certificates5
